

Ronan Quigley

ronan.quigley@live.com

Platform and backend engineer with 8+ years of experience building developer infrastructure, CI/CD pipelines, and high-scale distributed systems in Go, TypeScript and Python. I take ambiguous problems from ideation through to production, making the architectural decisions, building the solution, and seeing it through to measurable outcomes. I also drink peppermint tea. 🍵

Monzo - Senior Software Engineer

August 2025 to Present

- Integrated a third-party marketing platform, working with CRM to define and implement over 200 data features across personal and business banking.
- Created a data ingestion pipeline using Go, Python, BigQuery & Terraform. This enabled the launch of 15 campaigns, delivering over 50 million sends and a 3.7% uplift in iCVR.

Findmypast - Principal Software Engineer

Jul 2018 to June 2025

- Worked on a family history product featuring billions of searchable records.
- Progressed from full-stack engineering into a tech lead role for a platform and infrastructure engineering team. Reached a principal engineer level after five years.
- Restructured our main release pipeline, cutting deployment times from 40 minutes to less than 10 minutes. My changes saved 200 hours of deployment time each month.
- Scaled our entitlements system to hit a 12x traffic target, handling hundreds of thousands of entitlement checks on the 1921 census release day with zero downtime.
- Reduced development build times of our front-end monolith from 60 seconds to 1 second, dramatically improving developer productivity.
- Optimised GPU configuration for ML-based document ingestion pipelines. My changes cut projected processing times for one multi-million scale project from 2-3 months to 1 month. See my [blog](#) for a technical writeup.
- Rolled out a standardised & automated security testing suite, integrating secrets scanning, dependency vulnerability analysis, and distroless container images to improve the security and consistency of containerised deployments.
- Led engineering-wide sessions on DevOps practices, internal tooling, and onboarding, improving developer effectiveness and team ramp-up for a department of 80 engineers.
- Planned and implemented the migration of a 40 node production Kubernetes cluster from VMs to bare metal. The business impact was over 90% reduction in p95+ latency spikes due to virtualisation overhead, and only 6 production worker nodes to maintain.
- Delivered the migration of a feature toggle management system from Node.js to Go, yielding a 10x reduction in resource consumption and 3x reduction in response times.
- Architected an event-driven email notification system using Kafka, delivering over 1 million transactional and marketing emails.

- Leveraged LLMs for structured data extraction on newspaper clippings. The business managed to convert over a million images into accurate, searchable text.
- Designed and built the supporting REST API and backend for user-to-user messaging. The feature achieved a 20% adoption rate within the target cohort and a 43% reply rate to conversation requests.

Achievements

- BAFTA Scotland 2016 winner from a previous career in games development.
- Selected from over 200 applicants as one of 23 businesses to secure funding at the 2015 Scottish EDGE competition. I successfully pitched for a £30,000 award.

Personal Work

- I have been developing my own CI/CD platform, [Autograph](#), allowing users to provision containers for deployment pipelines by using a visual programming canvas.

Technical Skills

Languages & Runtimes: Go, Python, SQL, Node.js, TypeScript, JavaScript

Cloud & Infrastructure: AWS (S3, CloudFront, IAM), Kubernetes, Docker, Linux, Terraform, Ansible, Puppet, Helm

Messaging: Kafka

Databases: PostgreSQL, SQLite

Observability: Grafana, Prometheus

Networking & APIs: TCP, HTTP, REST, RPC, DNS
