

Ronan Quigley

ronan.quigley@live.com

I am a versatile software engineer and tech lead who delivers simple, scalable solutions in complex, large-scale environments. Experienced in both platform and product engineering, I enjoy owning problems from start to finish, all whilst working collaboratively with business stakeholders.

Monzo - Senior Software Engineer

August 2025 to Present

- Tech lead for integrating a third-party marketing platform, working with CRM to define and implement over 200 data features across personal and business banking.
- Created a data ingestion pipeline using Go, Python, Airflow & DBT. This enabled the launch of 14 campaigns, delivering over 50 million sends and a 3.7% uplift in iCVR.

Findmypast - Principal Software Engineer

Jul 2018 to June 2025

- Worked on a family history product featuring billions of searchable records.
- Initially contributed as a full-stack engineer, later specialising as a DevOps engineer.
- Advanced from Junior to a Principal Engineer level over 5 years.
- Restructured our main release pipeline, cutting deployment times from 40 minutes to less than 10 minutes. My changes saved 200 hours of deployment time each month.
- Increased the capacity of our entitlements system by 12x, handling hundreds of thousands of entitlement checks on the 1921 census release day with zero downtime.
- Reduced development build times of our front-end monolith from 60 seconds to 1 second, dramatically improving developer productivity.
- Partnered with product on scoping, defining success metrics, and leading technical delivery of user-to-user messaging. The feature delivered a 20%+ adoption rate in the target cohort and a 43% reply rate to conversation requests.
- Architected an event-driven email notification system using Kafka, delivering over 1 million transactional and marketing emails.
- Delivered the migration of a feature toggle management system from Node.js to Go, yielding a 10x reduction in resource consumption and 3x reduction in response times.
- Planned and implemented the migration of a 40 node production Kubernetes cluster from VMs to bare metal. The business impact was over 90% reduction in p95+ latency spikes due to virtualisation overhead, and only 6 production worker nodes to maintain.
- Leveraged LLMs for structured data extraction on newspaper clippings. The business managed to convert over a million images into accurate, searchable text.
- Optimised GPU configuration for ML-based document ingestion pipelines. My changes cut projected processing times for one multi-million scale project from 2-3 months to 1 month. See my [blog](#) for a technical writeup.
- Rolled out Teleport across our infrastructure, replacing manual key based auth with zero trust access management to over 500 machines.

Achievements

- BAFTA Scotland 2016 winner (game category) from a previous career in games development.
- Selected from over 200 applicants as one of 23 businesses to secure funding at the 2015 Scottish EDGE competition. I successfully pitched for a £30,000 award.

Skills

Go	Kubernetes	React
JavaScript	Docker	Svelte
TypeScript	Grafana	Node.js
Python	Prometheus	DBT
SQL	Claude Code	Puppet
Ansible	TeamCity	Git
